eschewing the usual mathematical explanations for physics phenomena this approachable reference explains complicated scientific concepts in plain english that everyone can understand tackling the big issues such as gravity magnetism sound and what really happens in the large hadron collider this engaging look at physics also spells out why cats always land on their feet why people appear to have red eyes in photographs and the real danger of looking at an eclipse for everyone who ever wondered how a light bulb works or how squirrels avoid electrocution on the power lines this handbook supplies answers on the physics of everyday life and examines the developments in the exploration of subatomic particles in addition to the question and answer section an addendum of facts about physicists explains what the nobel prize is and who has won it and tells the story of the scientist who was incarcerated for agreeing with copernicus answers more than eight hundred questions about physics ranging from everyday life applications to the latest explorations in the field

in order to equip hopeful graduate students with the knowledge necessary to pass the qualifying examination the authors have assembled and solved standard and original problems from major american universities boston university university of chicago university of colorado at boulder columbia university of maryland university of michigan michigan state michigan tech mit princeton rutgers stanford stony brook university of tennessee at knoxville and the university of wisconsin at madison and moscow institute of physics and technology a wide range of material is covered and comparisons are made between similar problems of different schools to provide the student with enough information to feel comfortable and confident at the exam guide to physics problems is published in two volumes this book part 2 covers thermodynamics statistical mechanics and quantum mechanics part 1 covers mechanics relativity and electrodynamics praise for a guide to physics problems part 2 thermodynamics statistical physics and quantum mechanics a guide to physics problems part 2 not only serves an important function but is a pleasure to read by

selecting problems from different universities and even different scientific cultures the authors have effectively avoided a one sided approach to physics all the problems are good some are very interesting some positively intriguing a few are crazy but all of them stimulate the reader to think about physics not merely to train you to pass an exam i personally received considerable pleasure in working the problems and i would guess that anyone who wants to be a professional physicist would experience similar enjoyment this book will be a great help to students and professors as well as a source of pleasure and enjoyment from foreword by max dresden an excellent resource for graduate students in physics and one expects also for their teachers daniel kleppner lester wolfe professor of physics emeritus mit a nice selection of problems thought provoking entertaining and just plain fun to solve giovanni vignale department of physics and astronomy university of missouri at columbia interesting indeed and enjoyable the problems are ingenious and their solutions very informative i would certainly recommend it to all graduate students and physicists in general particularly useful for teachers who would like to think about problems to present in their course joel lebowitz rutgers university a very thoroughly assembled interesting set of problems that covers the key areas of physics addressed by ph d qualifying exams will prove most useful to both faculty and students indeed i plan to use this material as a source of examples and illustrations that will be worked into my lectures douglas mills university of california at irvine
